

Abstract

A system, method and device is described for monitoring and billing the  
5 distribution of controlled content such as copyright material over a network or  
set of networks. A tag is described which may be incorporated in content for  
distribution on media including magnetic and optical disks and electronic files  
accessible via a network. The tag is retained within the content and permits a  
network device to identify the content as it passes through the network.
